Report under The Conservation of Habitats and Species Regulations 2017 (as amended), Regulation 9A

2019-2024

Conservation status assessment for the habitat:

H1210 - Annual vegetation of drift lines

Wales

Cyfoeth Naturiol Cymru
Natural Resources Wales

JNCC

For further information please contact:

Natural Resources Wales, Welsh Government Offices, Cathays Park, King Edward VII Avenue, Cardiff, CF10 3NQ. https://naturalresources.wales

JNCC, Quay House, 2 East Station Road, Fletton Quays, Peterborough, PE2 8YY. https://jncc.gov.uk

This report was produced by JNCC in collaboration with Natural Resources Wales.

This document should be cited as:

Natural Resources Wales and JNCC. (2026). Conservation status assessment for the habitat: H1210 Annual vegetation of drift lines.

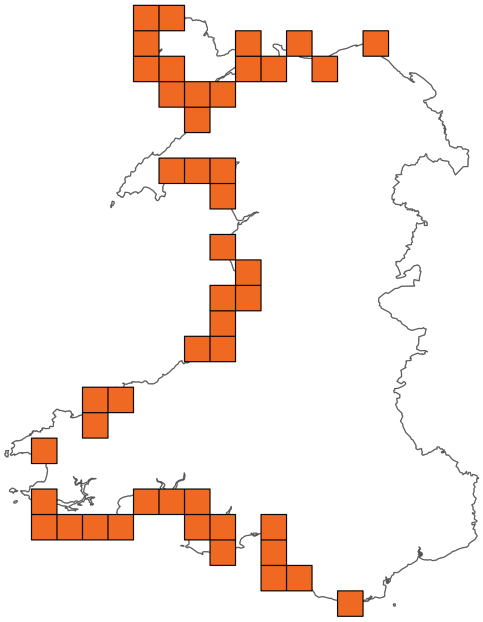
Important note - Please read

- The information in this document represents Wales Report under The Conservation of Habitats and Species Regulations 2017 (as amended), Regulation 9A, for the period 2019-2024.
- It is based on supporting information provided by Natural Resources Wales, which is documented separately.
- The Habitats Regulations reporting 2019-2024 Approach Document provides details on how this supporting information contributed to the UK Report and the fields that were completed for each parameter.
- Maps showing the distribution and range of the habitat are included.
- Explanatory notes (where provided) are included at the end. These provide additional audit trail information to that included within the assessments. Further underpinning explanatory notes are available in the related country reports.
- Some of the reporting fields have been left blank because either: (i) there was insufficient information to complete the field; (ii) completion of the field was not obligatory; and/or (iii) the field was not relevant to this habitat (section 11 National Site Network coverage for Annex I habitats).

Further details on the approach to the Habitats Regulations Reporting 2019-2024 are available on the JNCC website.

Assessment Summary: Annual vegetation of drift lines

Distribution Map



Range Map

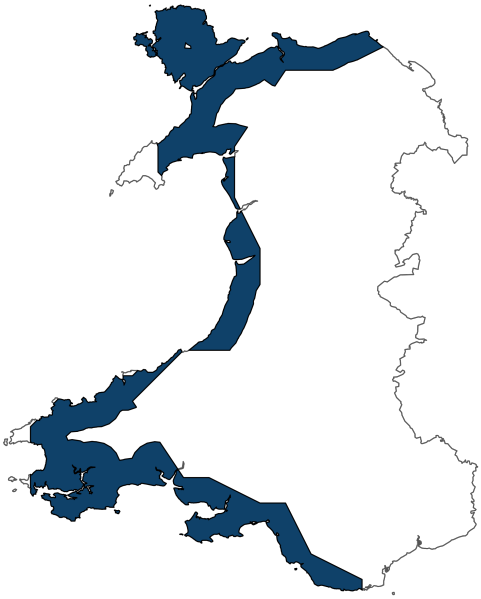


Figure 1: Wales distribution and range map for H1210 - Annual vegetation of drift lines. Coastline boundary derived from the Oil and Gas Authority's OGA and Lloyd's Register SNS Regional Geological Maps (Open Source). Open Government Licence v3 (OGL). Contains data © 2017 Oil and Gas Authority. The 10km grid square distribution map is based on available habitat records within the current reporting period.

Table 1: Table summarising the conservation status for H1210 - Annual vegetation of drift lines. Overall conservation status for habitat is based on assessments of range, area covered by habitat, structure and functions, and future prospects.

Overall Conservation Status (see section 10)

Unfavourable-inadequate (U1)

Breakdown of Overall Conservation Status

Range (see section 4)	**Unfavourable-inadequate (U1)**
Area covered by habitat (see section 5)	**Unfavourable-inadequate (U1)**
Structure and functions (see section 6)	**Unfavourable-inadequate (U1)**
Future prospects (see section 9)	**Unfavourable-inadequate (U1)**

List of Sections

National Level

1. General information

1.1 Country	Wales
1.2 Habitat code	H1210 - Annual vegetation of drift lines

2. Maps

2.1 Year or period	1989-2022
2.2 Distribution map	Yes
2.3 Distribution map; Method used	Complete survey or a statistically robust estimate

2.4 Additional information

No additional information

Biogeographical Level

3. Biogeographical and marine regions

3.1 Biogeographical or marine region where the habitat occurs	ATL

3.2 Sources of information

See section 13 References

4. Range

4.1 Surface area (km²)	4,422.02
4.2 Short-term trend; Period	2013-2024
4.3 Short-term trend; Direction	Stable
4.4 Short-term trend; Magnitude	

a) Estimated minimum

b) Estimated maximum	
c) Pre-defined range	
d) Unknown	
e) Type of estimate	
f) Rate of decrease	
4.5 Short-term trend; Method used	Complete survey or a statistically robust estimate
4.6 Long-term trend; Period	
4.7 Long-term trend; Direction	
4.8 Long-term trend; Magnitude	
a) Minimum	
b) Maximum	
c) Rate of decrease	
4.9 Long-term trend; Method used	

4.10 Favourable Reference Range (FRR)

a) Area (km²)	
b) Pre-defined increment	Current range is between 2% and 10% smaller than the FRR
c) Unknown	No
d) Method used	Reference-based approach
e) Quality of information	moderate

4.11 Change and reason for change in surface area of range

a) Change	Yes
b) Genuine change	No
c) Improved knowledge or more accurate data	Yes

d) Different method	Yes
e) No information	No
f) Other reason	No
g) Main reason	Improved knowledge/more accurate data

4.12 Additional information

No additional information

5. Area covered by habitat

5.1 Year or period	1989-2022
5.2 Surface area (km²)	
a) Minimum	
b) Maximum	
c) Best single value	0.393
5.3 Type of estimate	Best estimate
5.4 Surface area; Method used	Complete survey or a statistically robust estimate
5.5 Short-term trend; Period	
5.6 Short-term trend; Direction	Unknown
5.7 Short-term trend; Magnitude	
a) Estimated minimum	
b) Estimated maximum	
c) Pre-defined range	
d) Unknown	
e) Type of estimate	
f) Rate of decrease	
5.8 Short-term trend; Method used	Insufficient or no data available
5.9 Long-term trend; Period	1989-2022

5.10 Long-term trend; Direction	Stable
5.11 Long-term trend; Magnitude	
a) Minimum	
b) Maximum	
c) Confidence interval	
d) Rate of decrease	
5.12 Long-term trend; Method used	Complete survey or a statistically robust estimate
5.13 Favourable Reference Area (FRA)	
a) Area (km²)	
b) Pre-defined increment	Current area is between 2% and 10% smaller than the FRA
c) Unknown	No
d) Method used	Reference-based approach
e) Quality of information	moderate

5.14 Change and reason for change in surface area of range

a) Change	Yes
b) Genuine change	No
c) Improved knowledge or more accurate data	Yes
d) Different method	Yes
e) No information	No
f) Other reason	No
g) Main reason	Improved knowledge/more accurate data

5.15 Additional information

No additional information

6. Structure and functions

6.1 Condition of habitat (km²)	
Area in good condition	
ai) Minimum	0.2076
aii) Maximum	0.2076
Area not in good condition	
bi) Minimum	0.0505
bii) Maximum	0.0505
Area where condition is unknown	
ci) Minimum	0.1349
cii) Maximum	0.1349
6.2 Condition of habitat; Method used	Insufficient or no data available
6.3 Short-term trend of habitat area in good condition; Period	
6.4 Short-term trend of habitat area in good condition; Direction	Unknown
6.5 Short-term trend of habitat area in good condition; Method used	Insufficient or no data available
6.6 Typical species	
Has the list of typical species changed in comparison to the previous reporting period?	No
6.7 Typical species; Method used	

6.8 Additional information

Typical species were not used directly in the assessment of conservation status for habitat structure and function as a comprehensive list of typical species for each habitat was not available. However, the status of typical species was considered when the

condition of individual sites was assessed using Common Standards Monitoring Guidance. Common Standards Monitoring (CSM) data was used to assess the area of habitat in ‘good’ and ‘not good’ condition (field 6.1). Species were a component of the attributes assessed under CSM. Therefore, an assessment of species is considered to have formed part of the reporting under field 6.1 which supported the Habitats Structure and Function assessment (field 10.3).

7. Main pressures

7.1 Characterisation of pressures

Table 2: Pressures affecting the habitat, including timing and importance/impact ranking. Pressures are defined as factors acting currently and/or during the reporting period (2019–2024). Rankings are: High (direct/immediate influence and/or large spatial extent) and Medium (moderate direct/immediate influence, mainly indirect and/or regional extent).

Pressure	Timing	Ranking
PF04: Development and maintenance of beach areas for tourism and recreation	Ongoing and likely to be in the future	High (H)
PF05: Sports, tourism and leisure activities	Ongoing and likely to be in the future	High (H)
PF15: Modification of coastline, estuary and coastal conditions for built-up areas	Ongoing and likely to be in the future	High (H)
PJ01: Temperature changes and extremes due to climate change	Ongoing and likely to be in the future	Medium (M)
PJ03: Changes in precipitation regimes due to climate change	Ongoing and likely to be in the future	Medium (M)
PJ04: Sea-level rise due to climate change	Ongoing and likely to be in the future	Medium (M)
PJ06: Wave exposure changes due to climate change	Ongoing and likely to be in the future	High (H)
PJ07: Cyclones, storms, or tornados due to climate change	Ongoing and likely to be in the future	High (H)
PJ10: Change of habitat location, size, and / or quality due to climate change	Ongoing and likely to be in the future	High (H)

7.2 Sources of information

See section 13 References

7.3 Additional information

No additional information

8. Conservation measures

8.1: Status of measures

a) Are measures needed?	Yes
b) Indicate the status of measures	Measures identified, but none yet taken

8.2 Main purpose of the measures taken

8.3 Location of the measures taken

8.4 Response to measures

8.5 List of main conservation measures

Table 3: Key conservation measures addressing current pressures and/or anticipated threats during the next two reporting periods (2025–2036). Measures are ranked by importance/impact: High (direct/immediate influence and/or large spatial extent) and Medium (moderate direct/immediate influence, mainly indirect and/or regional extent).

Conservation measure	Ranking
MF02: Habitat restoration of areas impacted by residential, commercial, industrial and recreational infrastructure, operations and activities	High (H)
MF03: Reduce impact of outdoor sports, leisure and recreational activities (incl. restoration of habitats)	High (H)
MF08: Manage changes in hydrological and coastal systems and regimes for construction and development (incl. restoration of habitats).	High (H)
MH03: Reduce impact of other specific human activities	High (H)
MJ02: Implement climate change adaptation measures	High (H)
MM01: Management of habitats (others than agriculture and forest) to slow, stop or reverse natural processes that occur without direct or indirect influence from human activities or climate change	Medium (M)

8.6 Additional information

No additional information

9. Future prospects

9.1a Future trends of parameters

ai) Range	Overall stable
bi) Area	Unknown
ci) Structure and functions	Negative - slight/moderate deterioration

9.1b Future prospects of parameters

aii) Range	Poor
bii) Area	Unknown
cii) Structure and functions	Poor

9.2 Additional information

No additional information

10. Conclusions

10.1 Range	Unfavourable-inadequate (U1)
10.2 Area	Unfavourable-inadequate (U1)
10.3 Specific structure and functions (incl. typical species)	Unfavourable-inadequate (U1)
10.4 Future prospects	Unfavourable-inadequate (U1)
10.5 Overall assessment of Conservation Status	Unfavourable-inadequate (U1)
10.6 Overall trend in Conservation Status	Unknown

10.7 Change and reason for change in conservation status

This field is not reported as the period 2019-2024 marks the first instance in which conservation status has been assessed at the national level, meaning no comparisons to previous reports can be drawn.

10.7 Change and reason for change in conservation status trend

This field is not reported as the period 2019-2024 marks the first instance in which conservation status has been assessed at the national level, meaning no comparisons to previous reports can be drawn.

10.8 Additional information

No additional information

11. UK National Site Network (pSCIs, SCIs, SACs) coverage for Annex I habitat types

11.1 Surface area of the habitat type inside the pSCIs, SCIs and SACs network (km²)

a) Minimum	
b) Maximum	
c) Best single value	0.2877
11.2 Type of estimate	Best estimate
11.3 Habitat area inside the network; Method used	Complete survey or a statistically robust estimate
11.4 Short-term trend of habitat area within the network; Direction	Unknown
11.5 Short-term trend of habitat area within the network; Method used	Insufficient or no data available
11.6 Short-term trend of habitat area in good condition within the network; Direction	Unknown
11.7 Short-term trend of habitat area in good condition within the network; Method used	Insufficient or no data available

11.8 Additional information

No additional information

12. Complementary information

12.1 Justification of percentage thresholds for trends

No justification information

12.2 Other relevant information

No other relevant information

7.2 Sources of information

No sources of information

14. Explanatory Notes

Field label	Note
2.3: Distribution map; Method used	The 10km square distribution and habitat area estimates are derived from a combination of different original sources, summarised below. A single updated aggregated GIS layer has been created for this habitat across Wales (data source 1 below) joining together the maps and records from the other listed sources. Data source 1 (MAIN DATA SOURCE): Digital GIS Map Layer: Reg 9A H1210 Annual vegetation of drift lines Extent Layer 2025 (NRW, 2025) . This GIS layer (updated in 2025) supersedes the layer produced for the 2019 Article 17 submission. Data source 2 (MAIN DATA SOURCE): Sands of LIFE National Vegetation Classification (NVC) survey (Heathcote, Finch, Lamacraft, et al., 2022), is a vegetation survey of the Sands of LIFE sand dune sites using the UKs National Vegetation Classification (NVC) (Rodwell, 2000). Data source 3 (MAIN DATA SOURCE): Dynamic Dunescapes National Vegetation Classification (NVC) survey (Heathcote, Finch, Carter, et al., 2022), is a vegetation survey of the Dynamic Dunescapes Welsh sand dunes sites using the UKs National Vegetation Classification (NVC) (Rodwell, 2000). Data source 4 (MAIN DATA SOURCE): National Vegetation Classification Survey of coastal shingle sites in Wales 2022 (Heathcote, Finch, & Harrison, 2022), is a vegetation survey of the vegetated shingle structures around the coastline of Wales using the UKs National Vegetation Classification (NVC) (Rodwell, 2000) and Coastal Vegetated Shingle communities defined by Sneddon and Randall (Sneddon & Randall, 1993b).

	Data source 5 (MAIN DATA SOURCE): Sand Dune Vegetation Survey of Great Britain Part 3 – Wales (Dargie, 1995). This was a comprehensive survey of all sand dunes in Wales (Ashall, Duckworth, & Holder, 1992a, 1992b, 1994, 1995; Ashall, Duckworth, Holder, et al., 1992a, 1992b, 1992c, 1994a, 1994b; Ashall, Duckworth, Holder, McConnell, et al., 1995a, 1995b; Ashall, Duckworth, Holder, & Smart, 1995a, 1995b; Ashall et al., 1994, 1994, 1994, 1994, 1995, 1995; Ashall, Holder, et al., 1992; Ashall & Holder, 1992a, 1992b, 1992c; Duckworth et al., 1992, 1995a, 1995b, 1995c; Duckworth & Holder, 1995a, 1995b; Holder, Duckworth, et al., 1994; Holder, Smart, et al., 1994; Huckbody et al., 1993) based on the UKs National Vegetation Classification (NVC) (Rodwell, 2000). The H1210 vegetation equates to NVC communities: SD2 Honkenya peploides – Cakile maritima strandline; SD3 Matricaria maritima – Galium aparine strandline; MC6 Atriplex prostrata – Beta vulgaris ssp. maritima sea-bird cliff. The H1210 habitat is found in 47, 10km grid squares, the distribution differs to that reported in 2013 (23 grid squares), however, this is due to the use of recent surveys (Heathcote, Finch, Carter, et al., 2022; Heathcote, Finch, & Harrison, 2022; Heathcote, Finch, Lamacraft, et al., 2022) rather than a genuine change in the distribution of the feature. The data presented in this report is considered to give good representation of the current distribution and extent of this habitat.
4.3: Short-term trend; Direction	There is no evidence of actual change in the range of this habitat since the last report in 2018.
4.4: Short-term trend; Magnitude	Not applicable (no decrease in range), i.e. 'stable' see 4.3
4.8: Long-term trend; Magnitude	Not applicable (no decrease in range)

4.11: Change and reason for change in surface area of range	There is no evidence of actual change in the range of this habitat in Wales since the last report in 2018. However, more 10km2 grid squares have been recorded compared to 2018, this is due to the use of recent surveys (Heathcote, Finch, Carter, et al., 2022; Heathcote, Finch, & Harrison, 2022; Heathcote, Finch, Lamacraft, et al., 2022) confirming presence or absence of the habitat, rather than a genuine change in the distribution of the feature.
5.2: Surface area	Surface area figure has been generated from recent National Vegetation Classification (NVC) survey data from the Survey of coastal shingle sites in Wales, Sands of Life and Dynamic Dunescapes projects (Heathcote, Finch, Carter, et al., 2022; Heathcote, Finch, & Harrison, 2022; Heathcote, Finch, Lamacraft, et al., 2022). These datasets have been combined with two older datasets covering the remainder of the sand dune (sand dune survey of Wales (SDSW)) and shingle sites in Wales (Dargie, 1995; Sneddon & Randall, 1993a). Analysis of the 2022 data (Heathcote, Finch, Carter, et al., 2022; Heathcote, Finch, & Harrison, 2022; Heathcote, Finch, Lamacraft, et al., 2022) compared against the Sand Dune Vegetation Survey of Wales (Dargie, 1995) and the shingle sites in Wales survey (Sneddon & Randall, 1993a) shows that the habitat has changed in extent and area on some sites due to changes in coastal morphology, vegetation succession and changes in management. Overall increase in recorded area of 26.1 ha (66.4%).
5.3: Type of estimate	The Survey of coastal shingle sites in Wales, Sands of Life and Dynamic Dunescapes projects (Heathcote, Finch, Carter, et al., 2022; Heathcote, Finch, & Harrison, 2022; Heathcote, Finch, Lamacraft, et al., 2022) have provided a comprehensive (but not complete) representation of the habitat in Wales. These datasets have been combined with two older datasets covering the remainder of the sand dune (sand dune survey of Wales (SDSW)) and shingle sites in Wales (Dargie, 1995; Sneddon & Randall, 1993a).

5.6: Short-term trend; Direction	The habitat is very susceptible to damage from trampling and has been affected by vehicle access and parking. There is also concern that shoreline structures such as groins and seawalls are disrupting coastal processes and causing sediment starvation in places, which suggest that there may be localised losses at some sites.
5.8: Short-term trend; Method used	Little to no contemporary information exists on short term trends of area for this feature. Recent vegetation surveys (Heathcote, Finch, Carter, et al., 2022; Heathcote, Finch, & Harrison, 2022; Heathcote, Finch, Lamacraft, et al., 2022) will allow future losses or gains to be mapped. However, due to the ephemeral and dynamic nature of the habitat, fluctuations in area and extent are expected and unless attributed to known pressures, are deemed to be natural for this habitat type.
5.14: Change and reason for change in surface area	The change in the estimated area of this habitat is the result of the re-analysis of existing survey data (see section 5.2) in addition to the more accurate data for the areas of Annual vegetation of driftlines identified through recent survey work from the Survey of coastal shingle sites in Wales, Sands of Life and Dynamic Dunescapes projects (Heathcote, Finch, Carter, et al., 2022; Heathcote, Finch, & Harrison, 2022; Heathcote, Finch, Lamacraft, et al., 2022).
6.2: Condition of habitat; Method used	There is only one SAC in Wales with this Annex I habitat (Dee Estuary SAC) and unfortunately this habitat has not been assessed in terms of Common Standards Monitoring in this reporting round. However, the habitat has been condition assessed as part of the Sands of LIFE and Dynamic Dunescapes projects where it occurred within project sites with 9 sites reported to be in favourable condition.
7.1: Characterisation of pressures	The special sites (SSSI and SAC) include 86% of the H1210 resource in Wales by area. Pressures: Six pressures are ranked as having a High impact:

PF04: Development and maintenance of beach areas for tourism and recreation – Beach cleaning is a significant pressure on the Annual vegetation of driftlines habitat, where the activity removes the precursors to the strandline habitat development and thereby affecting any natural expansion of the habitat.

PF05: Sports, tourism and leisure activities – Annual vegetation of driftlines habitat is exposed to a high degree of pressure from sports, tourism and leisure activities, leading to damage of the habitat through trampling and general disturbance. Vehicle access to beaches is damaging the Annual vegetation of driftlines habitat on at least one site in Wales.

PF15: Modification of coastline, estuary and coastal conditions for built-up areas – Annual vegetation of driftlines are dependent on natural processes of sand movement and the habitat is being adversely affected by shoreline structures, especially where these are restricting sediment transport. Without an influx of new material, this habitat is likely to go into decline. There are four Shoreline Management plans in Wales which set policies for the long term sustainable management of the coast. The Habitats Regulations Assessments (HRAs) of these plans did not conclude that there would be adverse effects for SAC designated sand dunes because the policies applied to these sites were either managed realignment (to allow for active management) or no active intervention. In addition, the HRAs considered sediment supply from adjacent units, and where necessary, mitigation measures were included to ensure that coastal management updrift would not affect sediment supply to designated dune systems. Implementation of the SMPs and associated mitigation measures is required in order to help manage this pressure.

PJ06: Wave exposure changes due to climate change &

PJ07: Cyclones, storms, or tornados due to climate change – Large waves and storm surges are predicted to become more frequent with climate change with shingle, and driftline habitats at greater risk of being overtopped or breached during these events. Storm event wave exposure causes erosion of shingle and driftline habitats removing significant proportions of shingle vegetation, reducing sediment height and increasing the chance of future overtopping and breaching during storm events.

PJ10: Change of habitat location, size, and / or quality due to climate change – Shingle and driftline habitats can naturally fluctuate in size and location in response to geomorphological processes, however, these fluctuations are expected to be more pronounced and acute in response to climate change and the natural balance is likely to be disrupted affecting both structure and function of these coastal habitats.

Three pressures are ranked as having a Medium impact:

PJ01: Temperature changes and extremes due to climate change – Shingle and driftline habitats and species are adapted to drought conditions, however, premature desiccation and prolonged periods of drought associated with high temperatures can lead to community species change and an overall shift in species composition altering the overall structure and function of the habitat. Increases in summer temperatures may favour the establishment of invasive species (e.g. Red valerian and garden escapes)

PJ03: Changes in precipitation regimes due to climate change – Increased rainfall during winter months can favour INNS by facilitating growth (Burden et al., 2020) and affect overall vegetation composition.

PJ04: Sea-level rise due to climate change – Sea-level rise is likely to result in overall loss of the Annual vegetation of driftline habitat. Increased storminess may remove

	significant proportions sediment and driftline vegetation. Two pressures are ranked as having a Low impact: PD06: Transmission of electricity and communications (cables) – The potential impacts of cabling on shingle and driftline habitats relate to physical loss of extent and damage to the integrity of the habitats due to excavations, or the effects of cabling installation on underlying hydrology and geomorphology affecting the structure and function of the habitats. PI02: Other invasive alien species (other than species of Union concern) – The biodiversity and mobility of shingle and driftline habitats can be threatened by invasive species which outcompete native species and can stabilise the shingle / sand matrix. The pressures listed are considered to be current and applicable to future scenarios. Each of the pressures listed was regarded as being long term and there is no reason to suppose they will not continue to be applicable.
8.5: List of main conservation measures	The special sites (SSSI and SAC) include 86% of the H1210 resource in Wales by area. MF02: Habitat restoration of areas impacted by residential, commercial, industrial and recreational infrastructure, operations and activities - (Relates to Pressure PF15). Continued maintenance and upgrade of sea walls means that this pressure is continuing. Restoration of the shingle and driftline habitats by managed realignment would help to reinstate these habitats however, in locations where there is residential, commercial, industrial and recreational infrastructure this is unlikely to be viable. MF03: Reduce impact of outdoor sports, leisure and recreational activities (incl. restoration of habitats) – (Relates to pressure PF05).

Shingle and driftline habitats are susceptible to trampling and damage from human activities, such as beach cleaning. Reducing these impacts through engagement will enable these coastal habitats to be more resilient in the future.

MF08: Manage changes in hydrological and coastal systems and regimes for construction and development (incl. restoration of habitats) - (Relates to Pressure PF15).

Pressures relating to construction and development activities (coastal protection and sea defences) causing changes to hydrological conditions are continuing, restoration of shingle and driftline habitats impacted by these changes would be beneficial for the structure and function of these coastal habitats.

MH03: Reduce impact of other specific human activities – (PF04 and PF05).

Shingle and driftline habitats are susceptible to trampling and damage from human activities, such as beach BBQs. Reducing these impacts through public engagement will enable these coastal habitats to be more resilient in the future. Restricting vehicular beach access would be beneficial to these coastal habitats.

MJ02: Implement climate change adaptation measures – (Relates to Pressures PJ01, PJ03, PJ04, PJ06, PJ07, PJ10)

The creation of buffer zones with appropriate conservation management to allow for the dynamic movement of shingle and driftline habitats inland where there are no existing barriers would be beneficial. Where there are defences such as sea walls, targeted realignment to enable more connectivity of shingle and driftline habitats is desirable.

	MM01: Management of habitats (others than agriculture and forest) to slow, stop or reverse natural processes that occur without direct or indirect influence from human activities or climate change. Targeted management where required, when shingle and driftline habitats require restoring to a more open early-successional stage.
9.1:Future trends and prospects of parameters	Range: Despite several ongoing threats to the habitat, several sites have statutory protection which should ensure protection against total loss. Changes to the 10km2 distribution are considered unlikely in the short to medium term. Area: This habitat is being adversely affected by shoreline structures especially where these are restricting sediment transport. Without an influx of new material the area of the habitat is likely to reduce in the future. Large numbers of walkers and vehicle access, unless checked, will cause problems for the feature in the future. Predicted sea-level rise is likely to result in loss of the habitat and increased storminess may remove significant proportions of the vegetation, which if sustained consecutively over a number of years is likely to have a negative effect on the area of the habitat in the future. Beach cleaning is known to occur at several locations which are outside of the protected sites series and may have a detrimental effect on the integrity of the habitat and thus affecting future area of the habitat. Structure and function:

	This habitat is being adversely affected by shoreline structures especially where these are restricting sediment transport. Without an influx of new material the structure and function of the habitat is likely to be compromised in the future. Large numbers of walkers and vehicle access, unless checked, will cause problems for the structure and function of the feature in the future. Predicted sea-level rise is likely to result in loss of the habitat and increased storminess may remove significant proportions of the vegetation, which if sustained consecutively over a number of years is likely to have a negative effect on the structure and function of the habitat in the future. Beach cleaning is known to occur at several locations which are outside of the protected sites series and may have a detrimental effect on the integrity of the habitat and thus affecting future structure and function of the habitat. Taking the above into account it is likely that the future trend for the structure and function covered by the habitat is likely to be 'negative' if conservation measures are not implemented, however, until there is up-to-date survey information for the habitat in Wales, the future prospects of area will remain as 'unknown'. Taking the above into account it is likely that the future trend for the area covered by the habitat is likely to be 'negative' if conservation measures are not implemented. Furthermore, without future monitoring of the area of the habitat in Wales the future prospects of the area will be 'unknown'.
10.1: Range	Conclusion on Range reached because: (i) the short-term trend direction in Range surface area is stable; and (ii) the current Range surface area is not more than 10% below the Favourable Reference Range.

10.2: Area	Conclusion on Area reached because:(i) the short-term trend direction in Area is unknown; (ii) the current Area is not more than 10% below the Favourable Reference Area and iii) the change in distribution pattern is unknown.
10.3: Specific structure and functions	Conclusion on Structure and function reached because habitat condition data indicates that between c.5-25% of the habitat is in unfavourable (not good) condition.
10.4: Future prospects	Conclusion on Future prospects reached because: (i) the Future prospects for Range are poor; (ii) the Future prospects for Area covered by habitat are unknown; and (iii) the Future prospects for Structure and function are poor.
10.5: Overall assessment of Conservation Status	Overall assessment of Conservation Status is Unfavourable-inadequate because all the conclusions are Unfavourable-inadequate.
11.1: Surface area of the habitat type inside the pSCIs, SCIs and SACs network	This is the total surface area of the feature within SACs (irrespective of whether the feature has been notified).
5.13: Favourable Reference Area (FRA)	The UK-level FRV for surface area was developed by JNCC using an audit trail based on the year the FRV was first established and any changes made in subsequent reporting rounds. The audit may draw from any combination of the 2007, 2013, or 2019 Habitats Directive reports and reflects the full rationale used for the 2019 Article 17 reporting. This FRV was reviewed by Welsh experts and considered appropriate for use in Wales based on current habitat extent and trends.
4.10: Favourable Reference Range (FRR)	The UK-level FRV for range was developed by JNCC using an audit trail based on the year the FRV was first established and any changes made in subsequent reporting rounds. The audit may draw from any combination of the 2007, 2013, or 2019 Habitats Directive reports and reflects the full rationale used for the 2019 Article 17 reporting. This FRV was reviewed by Welsh experts and considered appropriate for use in Wales based

on current distribution and trends.
